

Executive Summary

Project: MoFlow: Smart Recurring Bill Payments Platform

Role: Business Analyst

Version: 1.0

Date: July 2026

MoFlow is a mobile-first digital payments platform designed to enable individuals and small businesses to automate recurring financial obligations through scheduled mobile money payments. The platform allows users to create, manage, and monitor recurring payments for expenses such as utility bills, internet subscriptions, school fees, rent, insurance premiums, and other recurring financial commitments.

Many mobile money users still rely on manually initiating recurring payments, which often results in missed due dates, late payment penalties, service interruptions, and unnecessary administrative effort. Existing payment solutions typically provide limited support for scheduling, reminders, and centralized management of recurring transactions, creating a fragmented and inefficient user experience.

The proposed solution addresses these challenges by providing an intuitive platform where users can schedule recurring payments, receive payment reminders, modify payment schedules, track transaction history, and manage all recurring obligations from a single dashboard. By automating routine payment activities, MoFlow aims to reduce missed payments, improve financial organization, and deliver a more convenient and reliable payment experience.

From a business perspective, MoFlow is expected to increase recurring transaction volumes, improve customer retention, reduce payment-related support requests, and strengthen user engagement through a seamless and automated payment experience. The solution also creates value for service providers by encouraging timely payments, improving customer satisfaction, and reducing payment default rates.

The primary users of MoFlow include salaried professionals, small business owners, students, and parents who regularly use mobile money services to manage recurring financial obligations. The platform is designed to address the unique payment behaviours and challenges faced by these user groups while providing a secure, accessible, and user-friendly experience.

In the role of Business Analyst, I conducted product discovery, stakeholder analysis, requirements elicitation, business process analysis, and documentation to define a solution that aligns user needs with business objectives. The project demonstrates the application of Business Analysis practices to support cross-functional collaboration between business stakeholders, product managers, UX designers, software engineers, and Quality Assurance (QA) teams throughout the product development lifecycle.

The deliverables produced in this case study including stakeholder analysis, user research, business and functional requirements, process models, wireframes, user stories, acceptance criteria, and delivery planning artifacts are designed to support Agile product development by providing clear, implementation-ready documentation that enables effective collaboration and informed decision-making across the project team.
